

# 03

## Machine Learning App with ANVIL

# Anvil Uplink

- We can connect code anywhere on the Internet to your Anvil app using the Anvil Uplink and vice versa, it's a two-way API.
- To enable the Uplink, click on gear menu and select 'Uplink'.

- Click the green 'Enable Uplink' button. You'll get a randomized id for your app.

# Server Uplink and Client Uplink

You can also use a 'client' Uplink key that only gives the permissions available to client-side code. You can use this to connect to untrusted code with a restricted set of permissions, so your data remains secure.

## Install the Uplink Library

On your own computer, install the Uplink library

```
pip install anvil-uplink
```

# Connect a Python Script to Our App

Put the example code below into our notebook

```
import anvil.server
anvil.server.connect("<your Uplink key>")

@anvil.server.callable
def our_function(name):
    print(f"Hello from your own machine, {name}!")

anvil.server.wait_forever()
```

Use this code in Anvil code editor to call function from Anvil

```
anvil.server.call('our_function', 'Anvil Developer')
```

## UI Design

This is the example for our house price prediction app.

### Startup Profit Prediction
